54 **Prostaglandin combinations in glaucoma therapy.**

57 The invention discloses a topical ophthalmic composition for the treatment of glaucoma and ocular hypertension, said composition comprising a combination of particular prostaglandins of the F and E series.

EP 0 603 800 A1

BACKGROUND OF THE INVENTION

This invention relates to the use of combinations of prostaglandins of the F and E series and their derivatives and analogues for the treatment of glaucoma and ocular hypertension. As used herein, the terms "prostaglandin" and "PG" shall refer to prostaglandins and derivatives and analogues thereof, except as otherwise indicated by context.

The structures of the naturally-occurring prostaglandins of the F and E series, of which the prostaglandins of the present invention are derivatives and/or analogues, are shown below:

PGF_{2α}PGE₂

Naturally-occurring prostaglandins are known to lower intraocular pressure (IOP) after topical ocular instillation, but can cause an inflammatory response (hyperemia). Many synthetic prostaglandins have been observed to lower intraocular pressure, but most such compounds also produce the described inflammatory response. This has been found to be particularly true for prostaglandins of the E series.

Various methods have been used in attempting to overcome this well-known inflammatory response. Stjernschatz et al. (WO 90/02553) have striven to synthesize derivatives of naturally-occurring prostaglandins in order to design out selectively the inflammatory response while maintaining the IOP-lowering effect. Others, including Ueno et al. (EP 330 511 A2) and Wheeler (EP 435 682 A2) have tried complexing prostaglandins with various cyclodextrins.

SUMMARY OF THE INVENTION

It has been unexpectedly discovered that co-administration of an E series prostaglandin and an F series prostaglandin in combination produces a greater reduction of IOP than the same dose of either type of compound given separately. In fact, as described in greater detail below, representative mixtures of the prostaglandins of the present invention produce a profound and long lasting IOP decrease. Administration of both types of prostaglandins in combination is apparently necessary to produce the desired IOP lowering effect for glaucoma therapy, while decreasing the likelihood of systemic side effects.

The extremely low dosage of the prostaglandin combinations of the present invention prevents or markedly decreases the local and/or systemic side effects seen with other glaucoma therapies -- especially those based on PG therapy. A dosage of a compound of formula (I) adequate to lower IOP produces local irritation and discomfort. The combination of a compound of formula (I) and a compound of formula (II) allows this dosage to be decreased by 90% or more, thereby eliminating or substantially reducing such irritation and discomfort.

Both PGF_{2α} and PGE₂ are naturally formed by the eye, and are normally present in aqueous humor as a combination. In addition, corneal tissue is capable of transforming exogenous PGF_{2α} into PGE₂ such that the PGE₂ concentration in aqueous humor is increased following topical ocular dosing with PGF_{2α}. It is therefore reasonable to propose that the potent IOP lowering effect of the present PG combinations is somehow attributable to the combination of a compound of formula (I), with a compound of formula (II). The limited response to dosage with PGF_{2α} alone is consistent with this proposed explanation. Although the mechanism for the observed synergism is unknown, it is clear that dosage with an optimum combination of a compound of formula (I) and a compound of formula (II) will allow a more potent reduction of intraocular pressure without the side-effects produced by treatment with an adequate dose of a single component.

DETAILED DESCRIPTION OF THE INVENTION

The compounds of the present invention are known. See, for example, The Merck Index, 10th Edition (1983), which is incorporated herein by reference to the extent that it describes the preparation and known pharmacological profiles of $\text{PGF}_{2\alpha}$ and PGE_2 . See also DE 2,223,365 (Bowler) and WO 90/02553 (Stjernschantz: et al.).

As used in this "Detailed Description of the Invention," the term " $\text{PGF}_{2\alpha}$ " shall refer to the prostaglandins of formula (I), and the term " PGE_2 " shall refer to the prostaglandins of formula (II).

Prostaglandins of the F series which are useful in the present invention have the general formula (I), shown below:

wherein:

- | | |
|-------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| X and Y | can be the same or different, and are: CH_2 or O; |
| R_1 | is hydrogen, a cationic salt moiety, a pharmaceutically acceptable amine moiety or a pharmaceutically acceptable ester moiety derived from the corresponding alcohol; and |
| R_2 | is hydrogen or a pharmaceutically acceptable ester moiety derived from the corresponding carboxylic acid. |
| R_3, R_4 and R_5 | can be the same or different, and are: H or CH_3 , with the proviso that if R_3 is CH_3 , then R_4 and R_5 are H; and |
| R_6 | is: C_{2-7} alkyl, thienyl or aryl, optionally substituted with one or more of the following: C_{1-5} alkyl, trifluoromethyl, or a halogen; |

with the proviso that if Y is O, and R_6 is aryl, then the aryl group must contain at least one substituent.

The following are preferred compounds of formula (I): cloprostenol, fluprostenol, PhXA41, 16,16-dimethyl- $\text{PGF}_{2\alpha}$, 15-methyl- $\text{PGF}_{2\alpha}$, 16-(3,5-dichloro-phenoxy)- $\text{PGF}_{2\alpha}$, tiaprost, 17-phenyl- $\text{PGF}_{2\alpha}$, 17-*m*-chlorophenyl- $\text{PGF}_{2\alpha}$, 17-*m*-trifluoromethylphenyl- $\text{PGF}_{2\alpha}$, 17-(3,5-dichlorophenyl)- $\text{PGF}_{2\alpha}$, and the 3-oxa- and 13,14-dihydro- derivatives of each, as appropriate. Structures of some of the preferred compounds are shown in the following Table 1. It is most preferred to use: cloprostenol, fluprostenol and PhXA41.

TABLE 1

COMPOUND NAME	STRUCTURE
1) PhXA41	
2) 16,16-dimethyl PGF _{2α}	
3) cloprostenol	
4) fluprostenol	
5) 13,14-dihydro-cloprostenol	
6) 3-oxa-cloprostenol	
7) 15-methyl PGF _{2α}	
8) 15-acetyl-16,16-dimethyl-PGF _{2α}	

Prostaglandins of the E series which are useful in the present invention have the general formula (II), shown below:

wherein:

R'_1 is hydrogen, a cationic salt moiety, a pharmaceutically acceptable amine moiety or a pharmaceutically acceptable ester moiety derived from the corresponding alcohol; and

R'_2 is hydrogen or a pharmaceutically acceptable ester moiety derived from the corresponding carboxylic acid.

As used herein, the term "pharmaceutically acceptable salts and esters" means esters and salts of these compounds which have the same general pharmacological properties as the acid form from which they are derived, and which are acceptable from a toxicity viewpoint. Specifically included by this term are salts and esters of the type disclosed in U.S. Patent No. 4,029,681 (June 19, 1977) and in U.S. Patent No. 4,288,616 (September 8, 1981), the disclosures of which are hereby incorporated in the present specification by reference. Thus, the compounds covered by the above general formulae include the free acid (R'_1 , $R_1 = H$) and alcohol (R'_2 , $R_2 = H$), alkali and alkaline earth metal salts (e.g., Na, K, Ca, and Mg), ammonium and amine salts, and esters (R'_1 , $R_1 = \text{alkyl}$, or R'_2 , $R_2 = \text{acyl}$). Preferred salts are those involving alkali and alkaline earth metal cations, particularly sodium and potassium, and amine salts, especially tris(hydroxymethyl)aminomethane salts. Preferred esters are C_1 - C_{12} alkyl esters, particularly straight or branched C_1 - C_6 alkyl esters, especially methyl, ethyl, isopropyl, cyclopropyl, cyclopropyl methyl, butyl, cyclobutyl, isobutyl, butyl or pentyl.

Alkali metal salts and alkaline earth metal salts of the acid form of (I) and (II) may be formed conventionally. The alcohol and/or acid or salt may be subsequently esterified with the appropriate acid and/or alcohol, e.g., a C_1 - C_3 alkyl alcohol, to yield the final ester product embodiment of (I) and (II) according to known procedures.

In a similar manner, other esterifications may be effected as is known in the art employing other low alkyl, cycloalkyl, cycloalkylalkyl, aryl, or arylalkyl alcohols and/or acids such as isopropanol, cyclopropanol, cyclopropylmethanol, or phenyl or benzyl alcohol. Since such esterification reactions are well known, they are not further described here.

Prostaglandins of formula (I) and formula (II) are combined in a molar ratio in the range of 0.1:1.0 to 1000:1, respectively. The preferred range is 4:1 to 20:1. Most preferred is a molar ratio of about 10:1.

The combinations of compounds of formulae (I) and (II) are useful in lowering intraocular pressure and thus are useful in the treatment of glaucoma. As compared with therapeutically effective dosages of the individual components, the combinations produce significantly fewer unwanted side effects such as marked vasoconstriction or vasodilation of the vessels of the sclera, painful stinging and intraocular inflammation.

The combinations are preferably administered topically. The dosage range for a compound of formula (I) is generally between about 0.01 and about 1000 micrograms per eye ($\mu\text{g}/\text{eye}$) and is preferably between about 0.05 and 5.0 $\mu\text{g}/\text{eye}$. The dosage range for a compound of formula (II) is generally between about 0.001 and about 5.0 $\mu\text{g}/\text{eye}$ and is preferably between about 0.01 and 0.5 $\mu\text{g}/\text{eye}$. The combinations of the present invention can be administered as solutions, suspensions, or emulsions (dispersions) in a suitable ophthalmic vehicle.

In forming compositions for topical administration, the mixtures are generally formulated as between about 0.0001 to about 1.0 percent by weight (wt%) solutions in water at a pH between 4.5 to 8.0 (figures relate to combined presence of (I) and (II)). The mixtures are preferably formulated as between about 0.0001 to about 0.1 wt% and, most preferably, about 0.002 wt%. While the precise regimen is left to the discretion of the clinician, it is recommended that the resulting solution be topically applied by placing one drop in each eye two times a day.

Other ingredients which may be desirable to use in the ophthalmic preparations of the present invention include preservatives, co-solvents and viscosity building agents.

Antimicrobial Preservatives:

Ophthalmic products are typically packaged in multidose form. Preservatives are thus required to prevent microbial contamination during use. Suitable preservatives include: benzalkonium chloride, thimerosal, chlorobutanol, methyl paraben, propyl paraben, phenylethyl alcohol, edetate disodium, sorbic acid, Onamer M, or other agents known to those skilled in the art. Such preservatives are typically employed at a level of from 0.001% to 1.0% by weight.

Co-Solvents:

10

Prostaglandins, and particularly ester derivatives, typically have limited solubility in water and therefore may require a surfactant or other appropriate co-solvent in the composition. Such co-solvents include: Polysorbate 20, 60 and 80; Pluronic F-68, F-84 and P-103; cyclodextrin; or other agents known to those skilled in the art. Such co-solvents are typically employed at a level of from 0.01% to 2% by weight.

15

Viscosity Agents:

Viscosity greater than that of simple aqueous solutions may be desirable to increase ocular absorption of the active compound, to decrease variability in dispensing the formulations, to decrease physical separation of components of a suspension or emulsion of formulation and/or otherwise to improve the ophthalmic formulation. Such viscosity building agents include, for example, polyvinyl alcohol, polyvinyl pyrrolidone, methyl cellulose, hydroxy propyl methylcellulose, hydroxyethyl cellulose, carboxymethyl cellulose, hydroxy propyl cellulose or other agents known to those skilled in the art. Such agents are typically employed at a level of from 0.01% to 2% by weight.

25

The following examples are representative pharmaceutical compositions of the invention for topical use in lowering of intraocular pressure. The Compound numbers used in the following Examples refer to the compounds of formula (I) which are listed in Table 1, above.

The invention has been described by reference to certain preferred embodiments; however, it should be understood that it may be embodied in other specific forms or variations thereof without departing from its spirit or essential characteristics. The embodiments described above are therefore considered to be illustrative in all respects and not restrictive, the scope of the invention being indicated by the appended claims rather than by the foregoing description.

Claims

1. A topical ophthalmic composition for the treatment of glaucoma and ocular hypertension, said composition comprising a combination of:

a) a therapeutically effective amount of a compound of formula (I):

wherein:

X and Y
 R_1

can be the same or different, and are: CH_2 or O;
is hydrogen, a cationic salt moiety, a pharmaceutically acceptable amine moiety or a pharmaceutically acceptable ester moiety derived from the cor-

- R₂ is hydrogen or a pharmaceutically acceptable ester moiety derived from the corresponding carboxylic acid.
 R₃, R₄ and R₅ can be the same or different, and are: H or CH₃, with the proviso that if R₃ is CH₃, then R₄ and R₅ are H; and
 R₆ is: C₂₋₇ alkyl, thienyl or aryl, optionally substituted with one or more of the following: C₁₋₅ alkyl, trifluoromethyl, or a halogen;
 with the proviso that if Y is O, and R₆ is aryl, then the aryl group must contain at least one substituent; and
 b) a therapeutically effective amount of a compound of formula (II):

wherein:

- R'₁ is hydrogen, a cationic salt moiety, a pharmaceutically acceptable amine moiety or a pharmaceutically acceptable ester moiety derived from the corresponding alcohol; and
 R'₂ is hydrogen or a pharmaceutically acceptable ester moiety derived from the corresponding carboxylic acid.
2. The composition of claim 1, wherein the compound of formula (I) is selected from the group consisting of: cloprostenol, fluprostenol, PhXA41, 16,16-dimethyl-PGF_{2α}, 15-methyl-PGF_{2α}, 16-(3,5-dichlorophenoxy)-PGF_{2α}, tiaprost, 17-phenyl-PGF_{2α}, 17-*m*-chlorophenyl-PGF_{2α}, 17-*m*-trifluoromethylphenyl-PGF_{2α}, 17-(3,5-dichlorophenyl)-PGF_{2α}, and the 3-oxa- and 13,14-dihydro- derivatives thereof.
 3. The composition of claim 2, wherein the compound of formula (I) is selected from the group consisting of: cloprostenol, fluprostenol and PhXA41.
 4. The composition of claim 1, wherein between about 0.01 and about 1000 micrograms of a compound of formula (I) is administered.
 5. The composition of claim 4, wherein between about 0.05 and about 5.0 micrograms of a compound of formula (I) is administered.
 6. The composition of claim 1, wherein between about 0.001 and about 5.0 micrograms of a compound of formula (II) is administered.
 7. The composition of claim 6, wherein between about 0.01 and about 0.05 micrograms of a compound of formula (II) is administered.
 8. The composition of claim 1, wherein the molar ratio of (I):(II) is between about 0.1:1 and about 1000:1.
 9. The composition of claim 8, wherein the molar ratio of (I):(II) is between about 4:1 and about 20:1.
 10. The composition of claim 9, wherein the molar ratio of (I):(II) is about 10:1.
 11. Use of the composition of one or more of claims 1 to 10 for the manufacture of a topical ophthalmic composition for the treatment of glaucoma and ocular hypertension.

INCOMPLETE SEARCH

Claims searched incompletely : 1-11

In view of the definition of products by means of their biological, chemical and or pharmacological properties, the search has to be restricted for economic reasons. The search was limited to the compounds for which pharmacological data was given and/or the compounds mentioned in the claims or examples.

(see guidelines, Part B, Chapter III, paragraph 3.6)
